Here is an implemented algorithm:

```
#include <iostream>
int count;
void do_something_costly() {
    count++;
}
void f(int n) {
    for (int i=0; i<n*100; i++) do_something_costly();</pre>
    for (int i=0; i<n; i++)
        for (int j=0; j<=i; j++)
             do_something_costly();
}
int main() {
    int sizes[] = {1, 10, 20, 30, 40, 50, 60, 70, 80, 90,
                          100, 200, 300, 400, 500, 600, 700, 800, 900,
                          1000, 2000, 3000, 4000, 5000, 6000, 7000,
                          8000, 9000, -1};
    int i=0;
    while (true) {
        int n = sizes[i++];
        if (n == -1) break;
        count = 0;
        f(n);
        std::cout << n << "," << count << "\n";
    }
}
Run this program on the console, and redirect the output to a file:
example.exe > cost.csv
note the .csv ending. MS Excel recognizes these files. The output is:
1,101

| 20 | | | |

Column A has n, and B has C(n), the cost of running the function with input size n.

Now, we suspect this is a quadratic function:

 $C(n) = An^2$

If we take logs of both sides, we get:

 $\log(C(n)) = \log(A) + 2\log(n)$

Thus we expect that a plot of $\log(C(n))$ versus $\log(n)$ should be a line with slope 2. Let's verify this. First, compute the logs in columns C and D:

Move the cursor to cell C1, and type =log(A1). Then go to cell D1, and type =log(B1).

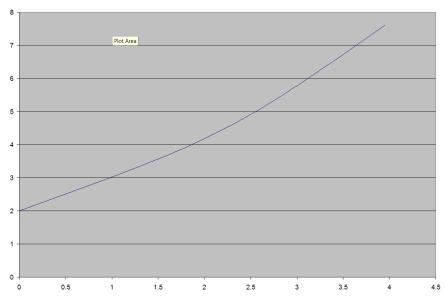

Then, select cells C1 and D1, and copy them into rows 2 through 28:

| | UΖ | \blacksquare | <i>j</i> w -L0 | الام) | |
|----|------|----------------|----------------|----------|---|
| | Α | В | С | D | |
| 1 | 1 | 101 | 0 | 2.004321 | |

| 11 | 100 | 15050 | 2 | 4.177536 | |
| 12 | 200 | 40100 | 2.30103 | 4.603144 | |
| 13 | 300 | 75150 | 2.477121 | 4.875929 | |
| 14 | 400 | 120200 | 2.60206 | 5.079904 | |
| 15 | 500 | 175250 | 2.69897 | 5.243658 | |
| 16 | 600 | 240300 | 2.778151 | 5.380754 | |
| 17 | 700 | 315350 | 2.845098 | 5.498793 | |
| 18 | 800 | 400400 | 2.90309 | 5.602494 | |
| 19 | 900 | 495450 | 2.954243 | 5.695 | |
| 20 | 1000 | 600500 | 3 | 5.778513 | |
| 21 | 2000 | 2201000 | 3.30103 | 6.34262 | |
| 22 | 3000 | 4801500 | 3.477121 | 6.681377 | |
| 23 | 4000 | 8402000 | 3.60206 | 6.924383 | |
| 24 | 5000 | 13002500 | 3.69897 | 7.114027 | |
| 25 | 6000 | 18603000 | 3.778151 | 7.269583 | |
| 26 | 7000 | 25203500 | 3.845098 | 7.401461 | |
| 27 | 8000 | 32804000 | 3.90309 | 7.515927 | |
| 28 | 9000 | 41404500 | 3.954243 | 7.617048 | |
| 29 | | | | | Ğ |

We can verify this visually with a plot of C vs D. Select C and D, rows 1 through 28:

| ï | | | | | , , , | |
|---|----|------|----------|----------|------------------|---|
| | | Α | В | С | D | |
| | 1 | 1 | 101 | 0 | 2.004321 | |
| | 2 | 10 | 1055 | 1 | 3.023252 | L |
| | 3 | 20 | 2210 | 1.30103 | 3.344392 | |
| | 4 | 30 | 3465 | 1.477121 | 3.539703 | |
| | 5 | 40 | 4820 | 1.60206 | 3.683047 | |
| | 6 | 50 | 6275 | 1.69897 | 3.797614 | |
| | 7 | 60 | 7830 | 1.778151 | 3.893762 | |
| | 8 | 70 | 9485 | 1.845098 | 3.977037 | |

| | 13 | 300 | 75150 | 2.477121 | 4.875929 | |
| | 14 | 400 | 120200 | 2.60206 | 5.079904 | L |
| | 15 | 500 | 175250 | 2.69897 | 5.243658 | |
| | 16 | 600 | 240300 | 2.778151 | 5.380754 | |
| | 17 | 700 | 315350 | 2.845098 | 5.498793 | |
| | 18 | 800 | 400400 | 2.90309 | 5.602494 | L |
| | 19 | 900 | 495450 | 2.954243 | 5.695 | L |
| | 20 | 1000 | 600500 | 3 | 5.778513 | L |
| | 21 | 2000 | 2201000 | 3.30103 | 6.34262 | L |
| | 22 | 3000 | 4801500 | 3.477121 | 6.681377 | L |
| | 23 | 4000 | 8402000 | 3.60206 | 6.924383 | L |
| | 24 | 5000 | 13002500 | 3.69897 | 7.114027 | L |
| | 25 | 6000 | 18603000 | 3.778151 | 7.269583 | L |
| | 26 | 7000 | 25203500 | 3.845098 | 7.401461 | L |
| | 27 | 8000 | 32804000 | 3.90309 | 7.515927 | L |
| | 28 | 9000 | 41404500 | 3.954243 | 7.617048 | |
| П | 20 | | | | Ī | |

Then choose Insert \to Scatter graph and get this plot, which looks straight at first, then shifts to a different straight line on the right side. This right side is the high values of n, and that's the behavior we're interested in:

It occurs when column C is 3 or more. So, let's ask Excel to give us the parameters of a straight line for that part of the data. In cell F20 (could be in any cell, actually), I'll type =slope(D20:D28,C20:C28).

(The D's are the y coords, and the C's are the x coords). And, in cell next to it, G20, I'll type =intercept(D20:D28,C20:C28).

Excel is telling us that, if we were to fit a least-squares straight line to the data in rows 20 to 28 of columns C and D, we would get

 $\log(C(n)) = m\log(n) + b$

with m = 1.93105176 and b = -0.025516668. But $b = \log(A)$, and if we compute = 10^{G20} we'll get A, which is 0.942938422.

Thus our empirical fit to the function C(n) is $C(n) \approx 0.9429 \times n^{1.931}$.

Does this work for n=9000? Pluggin in, we get 40769021, which is close to 41404500, the true value.
